

# Provisioning a Linux System with Ansible and YADM

Aidan Kahrs

# What are these things? They sound really cool

- Ansible is a python based configuration management and automation framework. <https://docs.ansible.com/ansible/intro.html>
- Usually deployed as a client and a server similar to Puppet and Chef
  - But it can be run locally which is why we will be using it.
- Based on the concept of playbooks
  - A file with a list of tasks to run
- YADM is Yet Another Dotfiles Manager, a wrapper around git with added features to make it useful for managing dotfiles
- <https://thelocihiliosan.github.io/yadm/>
- YADM adds encryption and alternate versions of files based on hostname, os and user among other things

Live Demo!

# Questions?

If you want my playbook or dotfiles see
